

# Gallium Nitride E-mode HEMT

## GS650EDC090B: 90 mΩ, 650V

### Description

Gallium Nitride High-Electron-Mobility Transistors (HEMTs) have shown outstanding results in high power applications. The large bandgap results in a high breakdown field, allowing for high operating voltages. Its inherent two-dimensional electron gas (2-DEG) at the AlGaN/GaN interface yields a high electron sheet charge density and mobility, significantly reducing resistive losses in power transistors. Additionally, due to the low gate charge and reverse recovery charge, the switching losses are reduced and switching speeds increased compared to traditional silicon power devices. The p-GaN gate is implemented to ensure the desired enhancement mode (normally-off) operation and improved slew rates.

The GS650EDC090B can be delivered as separate dice in waffle pack or packaged in a PDFN 8x8 or PDFN 5x6 with exposed paddle allowing an excellent thermal contact.

### Features

- 650V enhancement mode power transistor
- 850V transient drain-to-source voltage
- $R_{ds,on}(typ) = 90 \text{ m}\Omega$
- $I_{ds,max} = 16,7 \text{ A}$
- Ultra-low FOM
- Simple gate drive requirements: 0 to 6 V
- Transient tolerant gate drive: -20 V / +10 V
- High switching frequency > 1 MHz
- Reverse conduction capability
- Zero reverse recovery loss

### Applications

- Wall wart adapters
- Power Factor Correction
- LED drivers
- Battery Chargers
- Industrial Power Supplies
- Motor drivers
